SUMMARY

Software developer (B.E. in AI & Data Science, 2026) with R&D internship experience at NRSC, ISRO, building full-stack web applications and REST APIs with React.js, Node.js, MongoDB, and PostgreSQL, and deploying them with Docker.

EDUCATION

Sandip Institute of Technology and Research Center (SITRC)

Nashik, India

Bachelor of Engineering in Artificial Intelligence & Data Science

2022 – 2026

- **CGPA:** 7.92/10.0 — Top 15% in the Batch

EXPERIENCE

Research and Development Intern (On-Site)

Sept. 2025 – Jan. 2026

National Remote Sensing Center (NRSC), ISRO

Hyderabad, India

- Built full-stack web applications with Flask REST APIs and React.js frontends, including an automated solar panel detection system (94% precision) that serves YOLOv8 model predictions through a web interface.
- Developed a voice-controlled weather application using React.js and the Web Speech API, integrated with ISRO's KRITI geospatial chatbot.
- Containerized machine learning models and MERN applications with Docker and DockerHub, reducing environment setup time by 60% and keeping development and production environments consistent.

PROJECTS

FindOP — Opportunity Intelligence Platform | [GitHub](#)

Aug. 2026

React.js | TypeScript | Node.js | MongoDB | REST APIs | Web Scraping | Bright Data

- Built a full-stack opportunity intelligence platform that aggregates, normalizes, validates, and serves developer opportunities through REST APIs using TypeScript, Node.js, MongoDB, and Bright Data.
- Engineered a self-healing scraping pipeline that detects extraction failures, adapts to source changes, validates recovered data, and updates the platform through an automated ingestion workflow..

HookFlow — Reliable Webhook Delivery Platform | [GitHub](#)

Sept. 2026

PostgreSQL | Redis | REST APIs | Docker | Worker Pools | Go

- Designed and built a webhook delivery backend using Go, PostgreSQL, and Redis, with asynchronous job processing and concurrent worker pools for reliable event delivery.
- Implemented exponential-backoff retries, idempotency, and rate limiting to handle transient failures and prevent duplicate or excessive webhook deliveries.

VIKAS — Solar Panel Detection Web Application | [GitHub](#)

Nov. 2025

Python | Flask | REST APIs | Leaflet.js | YOLOv8 | OpenCV

- Built a Flask web application with RESTful APIs that runs YOLOv8 and OpenCV inference on satellite imagery to detect solar panels.
- Implemented coordinate search, interactive Leaflet.js maps, CSV uploads, area scanning, and prediction history to support large-scale geospatial analysis.

SKILLS

Languages	: TypeScript, JavaScript (ES6+), Go, Python, SQL
Frontend	: React.js, Tailwind CSS, Material UI, ShadCN UI, Responsive Design
Backend	: Node.js, Express.js, REST APIs, JWT Authentication, Prisma, Flask, Redis
Databases	: MongoDB, PostgreSQL
CS Fundamentals	: Data Structures & Algorithms, OOP, DBMS, Software Engineering
DevOps & Tools	: Docker, DockerHub, Git, GitHub, Postman, Vercel, Render.
Applied ML	: YOLOv8, OpenCV, NLP

ACHIEVEMENTS

- **NIT Surat × Odoo Hackathon (Apr. 2025):** Selected among 300+ teams across India to present a React.js, Node.js, and MongoDB solution before industry experts and startup mentors.
- **Research Publication, IJFMR (Oct. 2025):** Published “AI-Based Multilingual Assistant for Crowd Navigation & Emergency Response” in the International Journal for Multidisciplinary Research.
